

FOR IMMEDIATE RELEASE

SwissAI Vault Launches AI Multi-Sig Vault: A Discreet, AI-Driven Asset Coordination Platform for Private Clients

ZURICH, SWITZERLAND — April 2024

SwissAI Vault, an independent technology advisory group specializing in AI-based financial structuring, has officially launched the AI Multi-Sig Vault — a privacy-centric asset coordination interface designed for high-net-worth private clients and family offices.

The system enables algorithm-assisted multi-signature asset deployment across global custody channels, supported by human-supervised arbitration mechanisms for added operational security. Developed through informal collaborations between independent technologists and former members of Coinbase ' s infrastructure team, the initiative establishes a structured layer between high-net-worth principals and fragmented digital-asset environments.

Though not publicly advertised, the Vault has quietly gained traction within trusted professional circles through private referrals and advisory introductions.

“ We view AI Vault not as an investment platform but as a flexible intermediary architecture, ” said a SwissAI Vault spokesperson. “ It allows AI-driven decision layers to complement the judgment of private clients and wealth advisors, especially in today ' s increasingly fragmented custody environments. ”

Key features of the AI Multi-Sig Vault include:

- Human + AI Arbitration Protocol — Decision-making requires parallel validation by system intelligence and designated fiduciary agents.
- Segmented Risk Deployment — A multi-structure framework allows clients to diversify exposure across regions, themes, or partner nodes.
- Privacy-First Infrastructure — Operates under encrypted, tokenized permissions ensuring strict anonymity and ownership separation.
- No Public Access — The system is not marketed as a public product and does not constitute investment advice.

Access & Compliance Statement

The platform ' s public exposure remains minimal by design. Access is limited to encrypted invitations, pre-verified referrals, or trusted circle introductions. All external inquiries are handled manually through secure, confidential communication channels.
